| The abc conjecture claims that the sum of two numbers that factor a lot will not factor a lot.$\begin{gathered} \mathrm{a}+\mathrm{b}=\mathrm{c} \\ \text { with } \mathrm{c} \geq \mathrm{a}, \mathrm{~b} \text { and } \operatorname{gcd}(\mathrm{a}, \mathrm{~b})=1 \end{gathered}$ |  |  |
| For $\varepsilon>0$, there are only finitely many triples with quality $>1+\varepsilon$ where quality, $q$, of abc is defined as |  |  |
| abc Triple Qualities |  |  |
| $[\log (\operatorname{rad}(\mathbf{a b c}))]$ <br> i.e. $\mathrm{c}<\operatorname{rad}(\mathrm{abc})^{1+\varepsilon}$ |  |  |
|  |  |  |

## Background

Gaussian integers are the subring of the complex numbers consisting of elements $\boldsymbol{\alpha}=\mathrm{a}+\mathrm{bi}$ where a,b in $\mathbf{Z}$. They are mapped into the complex plane
as is shown below:

## Definitions

Norm: For $\boldsymbol{\alpha}=a+b i$ in $\mathbf{Z}[i]$, we define its norm by $N(\boldsymbol{\alpha})=a^{2}+b^{2}=|\boldsymbol{\alpha}|^{2}$
Prime Factorization:
Integers: For $\mathrm{n} \in \mathbf{Z} \geq 2$ can be written uniquely $\mathrm{n}=\mathrm{p}_{1}{ }^{\mathrm{e}{ }^{2}} \mathrm{p}_{2}{ }^{\mathrm{e}_{2}} \ldots \mathrm{p}_{\mathrm{r}}{ }^{{ }^{e_{t}}}$ where $\mathrm{p}_{1}<\mathrm{p}_{2}<\ldots<\mathrm{p}_{\mathrm{r}}$ are primes and $\mathrm{e}_{1}, \mathrm{e}_{2}, \ldots, \mathrm{e}_{\mathrm{r}} \in \mathbf{Z} \geq 1$

Gaussian integers: Every nonzero $\boldsymbol{\alpha}$ in $\mathbf{Z}[i]$ can be written uniquely as $\boldsymbol{\alpha}=\boldsymbol{u} \boldsymbol{\pi}_{1}{ }^{\mathrm{e}_{1}} \ldots \boldsymbol{\pi}_{\mathrm{r}}{ }^{\mathrm{e}_{\mathrm{r}}}$ where u is a unit, each $\boldsymbol{\pi}_{\mathrm{i}}$ is a Gaussian prime in the upper right quadrant or the positive real axis, and $\mathrm{e}_{\mathrm{i}}$ in $\mathbf{Z}$ 21

Radical: For $\mathrm{n} \in \mathbf{Z} \geq \mathbf{2}$ and $\boldsymbol{\alpha} \in \mathbf{Z}[\mathrm{i}]$

$$
\begin{gathered}
\operatorname{rad}(\mathrm{n}):=\mathrm{p}_{1} \mathrm{p}_{2} \ldots \mathrm{p}_{\mathrm{i}} \\
\operatorname{rad}(\boldsymbol{\pi}):=\boldsymbol{\pi}_{1} \boldsymbol{\pi}_{2} \ldots \pi_{\mathrm{i}}
\end{gathered}
$$

$\boldsymbol{\alpha} \boldsymbol{\beta} \boldsymbol{\gamma}$ Triple: Three nonzero Gaussian integers $\boldsymbol{\alpha}, \boldsymbol{\beta}, \boldsymbol{\gamma}$ such that

$$
\begin{gathered}
\alpha+\boldsymbol{\beta}=\gamma
\end{gathered}
$$

$\mathrm{N}(\boldsymbol{\gamma}) \geq \mathrm{N}(\boldsymbol{\alpha}), \mathrm{N}(\boldsymbol{\beta})$
$\boldsymbol{\alpha}=\mathrm{a}+\mathrm{bi} \boldsymbol{\beta}=\mathrm{c}+\mathrm{di} \operatorname{gcd}(\boldsymbol{\alpha}, \boldsymbol{\beta})=1$
Plot of Gaussian Primes:

## Findings

Hits with High Quality: (-30:30; excluding duplicates)

| $\alpha$ | $\beta$ | $\stackrel{r}{2}$ | 9 |

Histogram of Quality (-30:30; excluding duplicates):

Quality: $\quad \mathrm{q}=\log (\mathrm{N}(\boldsymbol{\gamma})) / \log (\mathrm{N}(\operatorname{rad}(\boldsymbol{\alpha} \boldsymbol{\beta} \boldsymbol{\gamma})))$
High Quality Hit: An $(\boldsymbol{\alpha}, \boldsymbol{\beta}, \gamma)$ triple with quality $>1$

## $\alpha \beta \gamma$ Conjecture

Let $\boldsymbol{\varepsilon}>0$
Then there are only finitely many $\boldsymbol{\alpha} \boldsymbol{\beta} \boldsymbol{\gamma}$ triples with quality $>1+\varepsilon$, i.e., $\mathrm{N}(\gamma)<\operatorname{rad}(\mathrm{N}(\boldsymbol{\alpha} \boldsymbol{\beta} \boldsymbol{\gamma}))^{\mathbf{1 +}}$ for all but finitely many triples
