Existence of isoperimetric problem is subtle

Perron (a colleague of Steiner) criticized Steiner symmetrization on the Euclidean isoperimetric problem:

Theorem

Among all curves of a given length, the circle encloses the greatest area.

Proof.

For any curve that is not a circle, there is a method (given by Steiner) by which one finds a curve that encloses greater area. Therefore the circle has the greatest area.

Theorem

Among all positive integers, the integer 1 is the largest.

Proof.

For any integer that is not 1, there is a method ("to take the square") by which on finds a larger positive integer. Therefore 1 is the largest integer.

Sets of finite perimeter

Definition

Let *E* be a Lebesgue-measurable set in \mathbb{R}^d , for any open set $\Omega \subseteq \mathbb{R}^d$, the **perimeter** of *E* in Ω , is

$$P(E;\Omega) := \sup\left\{\int_E \operatorname{div} T(x) \, \mathrm{d}x : T \in C^1_c(\Omega; \mathbb{R}^d), \|T\| \leqslant 1\right\}$$

Let μ_E be the distributional derivative of $\mathbb{1}_E$, then

$$P(E; \Omega) = |\mu_E|(\Omega) = Var(\mathbb{1}_E, \Omega).$$

000

Future work and open problems

◆□ ▶ ◆□ ▶ ◆三 ▶ ◆三 ▶ ◆○ ◆

Property of sets of finite perimeter

- We say $E_n \to E$ in Ω , if $\lim_{n \to \infty} \left| \Omega \cap (E \Delta E_n) \right| = 0$.
- E → P(E; Ω) is lower semi-continuous w.r.t convergence in measure.
- A sequence of sets of finite perimeter {E_n} in ℝ^d with sup_n P(E_n) < ∞ and E_n ⊆ B_R, then up to subsequences, there exists a set E of finite perimeter with

$$E_n \to E, \qquad E \subseteq B_R.$$

• De Giorgi's structure theorem: $P(E) = \mathcal{H}^{d-1}(\partial^* E).$

Future work and open problems

◆□ ▶ ◆□ ▶ ◆三 ▶ ◆三 ▶ ◆ ○ ◆ ○ ◆

Optimal Transport

- Given a compact domain Ω, W_p is a distance on P_p(Ω) and metrizes its weak topology.
- *W_p* is widely used in image processing, machine learning, fluid mechanism.
- Brenier's theorem:

For $p \ge 1$, given $\mu, \nu \in \mathbb{P}_p(\Omega)$ for some compact domain Ω , and $\mu \ll \mathscr{L}^d$, then there exists an optimal transport map Φ such that

$$W_p(\mu,\nu) = \left(\int_{\Omega} |x-\Phi(x)|^p d\mu(x)\right)^{1/p}$$

That is, $\gamma = (\mathbb{1} \times \Phi)_{\#} \mu$.

Step 1: Volume Constraint

Scaling rules:

$$r^d=m, \quad P(rE)=r^{d-1}P(E) \quad \text{and} \quad W_p(rE,rF)=r^{1+\frac{d}{p}}W_p(E,F).$$

Volume constraint problem, for $\lambda = m^{\frac{1}{p} + \frac{2}{d} - 1}$:

Minimize $P(E) + W_p(E, F)$ among all $(E, F) \in \mathcal{F}_m$.

Lack of compactness in unbounded domain leads to the failure of volume constraint.

Target: the uniform boundedness.

Property of Wasserstein functional (cont.)

Lemma (Lower semi-continuity of \mathcal{W}_p , [Xia, Z. 20']) Suppose $\{E_n\}$ is any sequence of sets of finite perimeter in \mathbb{R}^d with

$$\sup_n P(E_n) < \infty \quad \text{and} \quad E_n \subseteq B_R$$

for each n and some R > 0. If E_n converges to E, then we have

 $\mathcal{W}_p(E) \leq \liminf_{n\to\infty} \mathcal{W}_p(E_n).$

Main theorem

Theorem ([Xia, Z. 20'])

Suppose $d \ge 1$, $p \ge 1$ with $\frac{1}{p} + \frac{2}{d} > 1$, there exists an $m_0 > 0$ such that for any $m \le m_0$, the isoperimetric problem with Wasserstein penalty has a minimizer. Moreover, the minimizer is bounded. (Thus regularity results can be applied.)

Observation: Take $E = B_r$ with $|B_r| = m$. $P(B_r) \approx r^{d-1}$ and $\mathcal{W}_p(B_r) \approx \left(r^p r^d\right)^{1/p} = r^{1+\frac{d}{p}}$; $m \ll 1 \Rightarrow r \ll 1$; $P(B_r) \gg \mathcal{W}_p(B_r)$.

Step 3: Uniform bound

Theorem ([Xia, Z. 20'])

Suppose $p \ge 1$, $d \ge 1$ with $\frac{1}{p} + \frac{2}{d} > 1$, there exists an $m_0 > 0$ such that for every bounded set $G \subseteq \mathbb{R}^d$ of finite perimeter with $|G| \le m_0$, there exists a bounded set $E \subseteq \mathbb{R}^d$ of finite perimeter with

$$|E| = |G|, \quad T(E) \leq T(G) \quad and \quad E \subseteq B_2.$$
 (1)

Recipes of proof:

- [Figalli, Maggi, Pratelli 10'] Quantitative isoperimetric inequality;
- Non-optimality criteria;
- Gronwall's inequality.

Quantitative isoperimetric inequality

Theorem ([Figalli, Maggi, Pratelli 10'])

There exists a constant C(d) such that for any set $E \subseteq \mathbb{R}^d$ of finite perimeter, we have

$$\triangle(E,B_r)\leqslant C(d)\sqrt{\frac{P(E)-P(B_r)}{P(B_r)}},$$

where B_r is a d-ball with $|B_r| = |E|$, the Fraenkel asymmetry is given by

$$\triangle(E_1, E_2) := \min_{x \in \mathbb{R}^d} \frac{\left| E_1 \triangle (E_2 + x) \right|}{|E_1|},$$

Future work and open problems

Non-optimality criteria

Lemma (Nonoptimality criteria, [Xia, Z. 20']¹)

Suppose $d \ge 1$, $p \ge 1$ with $\frac{1}{p} + \frac{2}{d} > 1$, let $G \subseteq \mathbb{R}^d$ be a bounded set of finite perimeter with $|G| = m < \min\{1, \omega_d\}$. Suppose there is a partition of G into two disjoint sets of finite perimeter G_1 and G_2 with positive volumes such that

$$P(G_1)+P(G_2)-P(G)\leqslant \frac{1}{2}T(G_2). \tag{2}$$

Then there is an $\varepsilon = \varepsilon(m, d) > 0$ such that if

 $|G_2|\leqslant \varepsilon |G_1|,$

there exists a bounded set $E \subseteq \mathbb{R}^d$ such that |E| = |G| and T(E) < T(G).

・ロト ・ 日 ・ ・ ヨ ・ ・ 日 ・ うへぐ

Non-optimality criteria (cont.)

Figure: If a set G can be split into a dominated part G_1 and a remainder part G_2 , with a small slicing surface area bounded by $\frac{1}{4}T(G_2)$, then G may not be a T-minimizer.
