# ERRATA: SHIMURA CURVES OF GENUS AT MOST TWO 

JOHN VOIGHT

This note gives errata for the article Shimura curves of genus at most two [3]. These mistakes do not affect the main result; the list of curves is still complete and all curves have the correct signature (these signatures were independently verified, as in $\S 5)$. The author would like to thank James Rickards.

## Errata

(1) In the script to count, a human error caused the classical modular curve $X_{0}(11)$ to be counted as genus 0 . The corrected counts are $257,335,266$ of genus $0,1,2$ up to equivalence, and $334,589,438$ of genus $0,1,2$ fixing a unique field in each isomorphism class.
(2) Section 2, second paragraph: this is not a bijection, but a two-to-one mapan embedding and its conjugate give the same embedded finite subgroup.
(3) Lemma 2.1: The factor 2 from the previous mistake cancels the 2 in the denominator, so the corrected formula is:

$$
e_{q}=\frac{1}{h(F)} \sum_{\substack{R \subset K_{q} \\ w(R)=2 q}} \frac{h(R)}{Q(R)} \prod_{\mathfrak{p}} m\left(R_{\mathfrak{p}}, \mathcal{O}_{\mathfrak{p}}\right)
$$

(The formula that was implemented included both of these mistakes, the effect of which cancelled out.)
(4) Lemma 2.1: should be $Q(R)=\left[\mathrm{N}_{K_{q} / F}\left(R^{*}\right): \mathbb{Z}_{F}^{* 2}\right]$.
(5) Corollary 2.4: Same as the previous error: we have instead

$$
e_{q}=\frac{1}{h(F)} \prod_{\mathfrak{p} \mid \boldsymbol{D}}\left(1-\left(\frac{K_{q}}{\mathfrak{p}}\right)\right) \sum_{\substack{R \subset K_{q} \\ w(R)=2 q}} \frac{h(R)}{Q(R)}
$$

(6) Lemma 2.5 is incorrect as stated. The detailed correction is given in the next section.

## Embedding numbers

Lemma 2.5 is incorrect as stated. This mistake does not affect any other result in the paper; the list of curves is still complete and all curves have the correct signature (these signatures were independently verified, as in §5).

We give a complete and corrected statement and proof below. We retain the notation from $\S 2$. In particular, let $R_{\mathfrak{p}}=\mathbb{Z}_{F, \mathfrak{p}}\left[\gamma_{\mathfrak{p}}\right]$ and let $\pi$ be a uniformizer at $\mathfrak{p}$, and let $f_{\mathfrak{p}}(x)=x^{2}-t_{\mathfrak{p}} x+n_{\mathfrak{p}}$ denote the minimal polynomial of $\gamma_{\mathfrak{p}}$. Let $d_{\mathfrak{p}}=t_{\mathfrak{p}}^{2}-4 n_{\mathfrak{p}}$ and let $k(\mathfrak{p})$ denote the residue class field of $\mathfrak{p}$.

[^0]We will use the following proposition in the proof; see Hijikata [1, §2] and Vignéras [2, §III.3].
Proposition 2.3 (Hijikata [1, Theorem 2.3]).
(c) Suppose $\mathfrak{p} \mid \mathfrak{N}$. Let $e=\operatorname{ord}_{\mathfrak{p}}(\mathfrak{N})$ and for $s \geq e$ let

$$
E(s)=\left\{x \in \mathbb{Z}_{F} / \mathfrak{p}^{s}: f_{\mathfrak{p}}(x) \equiv 0\left(\bmod \mathfrak{p}^{s}\right)\right\}
$$

If $\operatorname{ord}_{\mathfrak{p}}\left(d_{\mathfrak{p}}\right)=0$ then

$$
m\left(R_{\mathfrak{p}}, \mathcal{O}_{\mathfrak{p}}\right)=\# E(e)
$$

Otherwise,

$$
m\left(R_{\mathfrak{p}}, \mathcal{O}_{\mathfrak{p}}\right)=\# E(e)+\# \operatorname{img}\left(E(e+1) \rightarrow \mathbb{Z}_{F} / \mathfrak{p}^{e}\right)
$$

The corrected lemma is then as follows.
Lemma 2.5. Let $\mathfrak{p}$ be an odd prime. Suppose $e=\operatorname{ord}_{\mathfrak{p}}(\mathfrak{N}) \geq 1$, let $r=\operatorname{ord}_{\mathfrak{p}}\left(d_{\mathfrak{p}}\right)$, and let $\kappa=\# k(\mathfrak{p})$.

- If $r=0$, then

$$
m\left(R_{\mathfrak{p}}, \mathcal{O}_{\mathfrak{p}}\right)=1+\left(\frac{K_{q}}{\mathfrak{p}}\right)
$$

- If $e<r$, then

$$
m\left(R_{\mathfrak{p}}, \mathcal{O}_{\mathfrak{p}}\right)= \begin{cases}2 \kappa^{(e-1) / 2}, & \text { if } e \text { is odd } \\ \kappa^{e / 2-1}(\kappa+1), & \text { if } e \text { is even }\end{cases}
$$

- If $e=r$, then

$$
m\left(R_{\mathfrak{p}}, \mathcal{O}_{\mathfrak{p}}\right)= \begin{cases}\kappa^{(r-1) / 2}, & \text { if } r \text { is odd } \\ \kappa^{r / 2}+\kappa^{r / 2-1}\left(1+\left(\frac{K_{q}}{\mathfrak{p}}\right)\right), & \text { if } r \text { is even }\end{cases}
$$

- If $e>r>0$, then

$$
m\left(R_{\mathfrak{p}}, \mathcal{O}_{\mathfrak{p}}\right)= \begin{cases}0, & \text { if } r \text { is odd } \\ \kappa^{r / 2-1}(\kappa+1)\left(1+\left(\frac{K_{q}}{\mathfrak{p}}\right)\right), & \text { if } r \text { is even }\end{cases}
$$

Proof. Since $\mathfrak{p}$ is odd, without loss of generality we may assume that $\operatorname{trd}\left(\gamma_{\mathfrak{p}}\right)=0$, and hence $E(s)$ is in bijection with

$$
E(s)=\left\{x \in \mathbb{Z}_{F} / \mathfrak{p}^{s}: x^{2} \equiv d_{\mathfrak{p}}\left(\bmod \mathfrak{p}^{s}\right)\right\}
$$

First suppose $r=0$. By Proposition $2.3(\mathrm{c})$, we have $m=m\left(R_{\mathfrak{p}}, \mathcal{O}_{\mathfrak{p}}\right)=\# E(e)$, and by Hensel's lemma we see that $\# E(e)=0$ or 2 according as $d_{\mathfrak{p}}$ is a square or not in $\mathbb{Z}_{F, \mathfrak{p}}$. In all other cases, we have the second case of Proposition 2.3(c).

Now suppose that $e<r$. The solutions to the equation $x^{2} \equiv 0\left(\bmod \mathfrak{p}^{s}\right)$ are those with $x \equiv 0\left(\bmod \mathfrak{p}^{\lceil s / 2\rceil}\right)$. Thus $\# E(e)=\kappa^{e-\lceil e / 2\rceil}=\kappa^{\lfloor e / 2\rfloor}$ and we see that \# $\operatorname{img}\left(E(e+1) \rightarrow R / \mathfrak{p}^{e}\right)=\kappa^{e-\lceil(e+1) / 2\rceil}$, so $m=2 \kappa^{(e-1) / 2}$ if $e$ is odd and $m=\kappa^{e / 2}+\kappa^{e / 2-1}=\kappa^{e / 2-1}(\kappa+1)$ if $e$ is even.

If $e=r$, then again $\# E(e)=\kappa^{\lfloor e / 2\rfloor}$. Now to count the second contributing set, we must solve $x^{2} \equiv d_{\mathfrak{p}}\left(\bmod \mathfrak{p}^{e+1}\right)$. If $e=r$ is odd then this congruence has no solution. If instead $e$ is even then we must solve $y^{2}=\left(x / \pi^{r / 2}\right)^{2} \equiv d_{\mathfrak{p}} / \pi^{r}$ $(\bmod \mathfrak{p})$ where $\pi$ is a uniformizer at $\mathfrak{p}$. This latter congruence has zero or two solutions according as $d_{\mathfrak{p}}$ is a square, and given such a solution $y$ we have the
solutions $x \equiv y\left(\bmod \pi^{r / 2+1}\right)$ to the original congruence, and hence there are 0 or $2 \kappa^{r-(r / 2+1)}=2 \kappa^{r / 2-1}$ solutions, as claimed.

Finally, suppose $e>r>0$. If $r$ is odd, there are no solutions to $x^{2} \equiv d_{\mathfrak{p}}$ $\left(\bmod \mathfrak{p}^{e}\right)$. If $r$ is even, there are no solutions if $d_{\mathfrak{p}}$ is not a square and otherwise the solutions are $x \equiv y\left(\bmod \mathfrak{p}^{e-r / 2}\right)$ as above so they total $2 \kappa^{r / 2}+2 \kappa^{r / 2-1}=$ $2 \kappa^{r / 2-1}(\kappa+1)$.

The author would like to thank Virgile Ducet and to Steve Donnelly for bringing this error to his attention.
