

Quiz 2, Math 38, Spring 2012

Instructions:

Always (briefly) explain or demonstrate why, unless told otherwise.

In counting problems, answers like " $\binom{5}{2} + 2^4 + 3 * 5$ " are usually preferable to "41".

(1) How many spanning trees does K_5 have?

Since K_5 has every tree on 5 vertices,
 K_5 has
 $n^{n-2} = 5^3$ sp. trees

(2) How many spanning trees does the following graph have?

$$\begin{aligned}
 \tau(G) &= \tau(G-e) + \tau(G \cdot e) \\
 \tau\left(\begin{array}{ccc} 1 & 2 & 3 \\ \bullet & \bullet & \bullet \\ \bullet & \bullet & \bullet \\ 6 & 5 & 4 \end{array}\right) &= \tau\left(\begin{array}{ccc} \bullet & \bullet & \bullet \\ \bullet & \bullet & \bullet \\ \bullet & \bullet & \bullet \end{array}\right) + \tau\left(\begin{array}{ccc} \bullet & \bullet & \bullet \\ \bullet & \bullet & \bullet \\ \bullet & \bullet & \bullet \end{array}\right) \\
 &= \tau\left(\begin{array}{ccc} \bullet & \bullet & \bullet \\ \bullet & \bullet & \bullet \\ \bullet & \bullet & \bullet \end{array}\right) + \tau\left(\begin{array}{ccc} \bullet & \bullet & \bullet \\ \bullet & \bullet & \bullet \\ \bullet & \bullet & \bullet \end{array}\right) \\
 &\quad + \tau\left(\begin{array}{ccc} \bullet & \bullet & \bullet \\ \bullet & \bullet & \bullet \\ \bullet & \bullet & \bullet \end{array}\right) + \tau\left(\begin{array}{ccc} \bullet & \bullet & \bullet \\ \bullet & \bullet & \bullet \\ \bullet & \bullet & \bullet \end{array}\right) \\
 &= 5 + 2 * 3 + 2 * 2 + 3 * 2 \\
 &= \boxed{21}
 \end{aligned}$$

(3) How many trees are there in the same isomorphism class as the one below?

One vertex of degree 4 ; one of degree 2
 (uniquely identifies those vertices)

Then 3 vertices adjacent to the $d(v)=4$ vertex
 that are leaves.

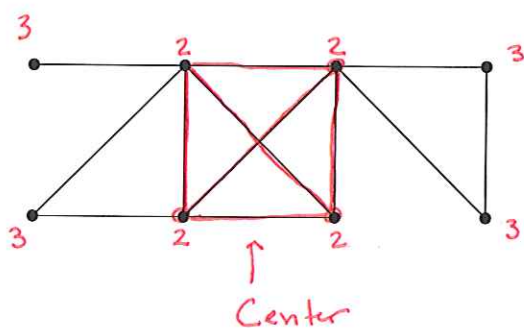

$$6 * 5 * \binom{4}{3} = \boxed{120}$$

- (4) For the following graph,
- label each vertex with its eccentricity,
 - trace over the center of G ,
 - give its diameter,
 - give its radius.

No need to justify.

$$\text{diam} = 3$$

$$\text{rad} = 2$$

- (5) For the same graph as above, without drawing the complement \bar{G} , can you give upper and/or lower bounds on the diameter of \bar{G} ?

Since $\text{diam}(G) \geq 3$,

we have $\text{diam}(\bar{G}) \leq 3$.

Also G has edges, so

$\text{diam}(\bar{G}) \geq 2$.

- (6) Is the following statement true or false? If true, explain why. If false, give a counter-example and a similar statement which is true. (no need to prove)

A graph G is a tree if ~~or~~ ^{and} only if every edge is a cut edge.

False:  is not a tree, but e is a cut edge.

Better

A graph G is a tree if and only if it is connected and every edge is cut.

-or-

A graph G is a forest iff every edge is cut.

- (7) State four (other?) ways to characterize trees with n vertices.

(No need to prove, just state them. Don't reuse (6).)

Some set of properties X characterize trees on n vertices if you can make the statement "A graph G with n vertices is a tree if and only if G has properties X ".

- (1) G is connected and acyclic
- (2) G is connected w/ $n-1$ edges
- (3) G is acyclic w/ $n-1$ edges
- (4) for every pair $u, v \in V(G)$, there is exactly one $u-v$ path in G , and G is loopless.
- (5) Adding any edge w/ endpoints in $V(G)$ creates exactly one cycle, and G is loopless.
