## The dual of a plane graph

## Definition

The dual graph $G^{*}$ of a plane graph $G$ is a plane graph whose vertices correspond to the faces of $G$. Edges of $G^{*}$ correspond to edges of $G$, so that if $e \in E(G)$ bounds two faces, then the endpoints of the corresponding edge $e^{*} \in E\left(G^{*}\right)$ are the vertices that correspond to those two faces.

## The dual of a plane graph

## Definition

The dual graph $G^{*}$ of a plane graph $G$ is a plane graph whose vertices correspond to the faces of $G$. Edges of $G^{*}$ correspond to edges of $G$, so that if $e \in E(G)$ bounds two faces, then the endpoints of the corresponding edge $e^{*} \in E\left(G^{*}\right)$ are the vertices that correspond to those two faces.

If $G$ is connected, then $\left(G^{*}\right)^{*}$ is isomorphic to $G$.

## The dual of a plane graph

## Definition

The dual graph $G^{*}$ of a plane graph $G$ is a plane graph whose vertices correspond to the faces of $G$. Edges of $G^{*}$ correspond to edges of $G$, so that if $e \in E(G)$ bounds two faces, then the endpoints of the corresponding edge $e^{*} \in E\left(G^{*}\right)$ are the vertices that correspond to those two faces.

If $G$ is connected, then $\left(G^{*}\right)^{*}$ is isomorphic to $G$.
Note: Different embeddings of the same graph can yield different dual graphs.

## The length of a face

Definition
A length of a face in a plane graph is the length of the closed walk bounding the face.

## The length of a face

## Definition

A length of a face in a plane graph is the length of the closed walk bounding the face.

Denote by $\ell(F)$ the length of face $F$. It equals the degree of the corresponding vertex in the dual graph.

## The length of a face

## Definition

A length of a face in a plane graph is the length of the closed walk bounding the face.

Denote by $\ell(F)$ the length of face $F$. It equals the degree of the corresponding vertex in the dual graph.

## Proposition

In every plane graph $G$,

$$
\sum_{F \text { face of } G} \ell(F)=
$$

## The length of a face

## Definition

A length of a face in a plane graph is the length of the closed walk bounding the face.

Denote by $\ell(F)$ the length of face $F$. It equals the degree of the corresponding vertex in the dual graph.

## Proposition

In every plane graph $G$,

$$
\sum_{F \text { face of } G} \ell(F)=2 e(G)
$$

## The length of a face

## Definition

A length of a face in a plane graph is the length of the closed walk bounding the face.

Denote by $\ell(F)$ the length of face $F$. It equals the degree of the corresponding vertex in the dual graph.

## Proposition

In every plane graph $G$,

$$
\sum_{F \text { face of } G} \ell(F)=2 e(G) .
$$

Proof: Apply the handshaking lemma to the dual graph.

## Euler's formula

## Theorem (Euler's formula)

If $G$ is a connected planar graph with $n$ vertices, e edges and $f$ faces, then

## Euler's formula

## Theorem (Euler's formula)

If $G$ is a connected planar graph with $n$ vertices, e edges and $f$ faces, then

$$
n-e+f=2
$$

## Euler's formula

## Theorem (Euler's formula)

If $G$ is a connected planar graph with $n$ vertices, e edges and $f$ faces, then

$$
n-e+f=2
$$

## Theorem

If $G$ is a simple planar graph with $n \geq 3$ vertices and e edges, then

$$
e \leq 3 n-6
$$

## Euler's formula

## Theorem (Euler's formula)

If $G$ is a connected planar graph with $n$ vertices, e edges and $f$ faces, then

$$
n-e+f=2
$$

## Theorem

If $G$ is a simple planar graph with $n \geq 3$ vertices and e edges, then

$$
e \leq 3 n-6
$$

If, additionally, $G$ has no triangles, then

$$
e \leq 2 n-4
$$

## Euler's formula

## Theorem (Euler's formula)

If $G$ is a connected planar graph with $n$ vertices, e edges and $f$ faces, then

$$
n-e+f=2
$$

## Theorem

If $G$ is a simple planar graph with $n \geq 3$ vertices and e edges, then

$$
e \leq 3 n-6
$$

If, additionally, $G$ has no triangles, then

$$
e \leq 2 n-4
$$

## Corollary

- $K_{5}$ is not planar.

## Euler's formula

## Theorem (Euler's formula)

If $G$ is a connected planar graph with $n$ vertices, e edges and $f$ faces, then

$$
n-e+f=2
$$

## Theorem

If $G$ is a simple planar graph with $n \geq 3$ vertices and e edges, then

$$
e \leq 3 n-6
$$

If, additionally, $G$ has no triangles, then

$$
e \leq 2 n-4
$$

## Corollary

- $K_{5}$ is not planar.
- $K_{3,3}$ is not planar.

## A characterization of planar graphs

## Definition

A subdivision of a graph is obtained from it by replacing edges with pairwise internally disjoint paths.
(Equivalently, by inserting some vertices into edges of the graph.)

## A characterization of planar graphs

## Definition

A subdivision of a graph is obtained from it by replacing edges with pairwise internally disjoint paths.
(Equivalently, by inserting some vertices into edges of the graph.)

Theorem (Kuratowski's Theorem)
A graph is planar if and only if it does not contain a subdivision of $K_{5}$ or $K_{3,3}$ as a subgraph.

## A characterization of planar graphs

## Definition

A subdivision of a graph is obtained from it by replacing edges with pairwise internally disjoint paths.
(Equivalently, by inserting some vertices into edges of the graph.)

## Theorem (Kuratowski's Theorem)

A graph is planar if and only if it does not contain a subdivision of $K_{5}$ or $K_{3,3}$ as a subgraph.

Easy direction: if $G$ contains a subdivision of $K_{5}$ or $K_{3,3}$, then $G$ is not planar.

## Another similar characterization

## Definition

A minor of a graph $G$ is a graph that can be obtained from $G$ by deleting and/or contracting edges of $G$.

## Another similar characterization

## Definition

A minor of a graph $G$ is a graph that can be obtained from $G$ by deleting and/or contracting edges of $G$.

## Theorem (Wagner '37)

A graph is planar if and only if it does not contain $K_{5}$ nor $K_{3,3}$ as a minor.
